

9

7. The communication device of claim 6 wherein the radiotelephone further includes first operating circuitry operable at said first supply voltage and the modem circuit further includes second operating circuitry operable at the second supply voltage, the second supply voltage differing 5 from the first supply voltage.

8. The communication device of claim 6 wherein the one or more data circuits are configured to convert voltage levels

10

for communication with the one or more logic circuits to the voltage level of the interface node.

9. The device of claim 6 wherein said positive voltage level of said interface node is the greater of said first and second supply voltages.
